AZV99

PECL/LVDS Oscillator Gain Stage & Buffer with Selectable Enable

www.azmicrotek.com

DESCRIPTION

The AZV99 is a specialized oscillator gain stage with an LVDS output buffer including an enable. The selectable enable input allows continuous oscillator operation by only controlling the Q_{HG} /$\overline{Q}_{HG}$ outputs.

The AZV99 provides adjustable internal pull-down current sources for the Q/$\overline{Q}$ outputs. Internal input biasing further reduces the number of needed external components

FEATURES

- Minimizes External Components
- Selectable Enable Polarity and Threshold (CMOS or PECL)
- 3V to 5.5V Power Supply
- Similar Operation as AZ100LVEL16VT except with LVDS Outputs

ENGINEERING NOTES

The AZV99 is a specialized oscillator gain stage with LVDS output buffer including an enable. The enable input (EN) allows continuous oscillator operation by only controlling the Q_{HG} /$\overline{Q}_{HG}$ outputs.

The AZV99 also provides a V_{BB} and 470Ω internal bias resistors from D to V_{BB} and $\overline{D}$ to V_{BB}. The V_{BB} pin can support 1.5 mA sink/source current. Bypassing V_{BB} to ground with a 0.01 µF capacitor is recommended.

FUNCTIONALITY MLP16 PACKAGE (AZV99L)

The MLP16 and die versions of the AZV99 provide a selectable enable (EN). Enable polarity and threshold can be selected to accommodate either CMOS/TTL or PECL input levels. See the enable truth table for enable function. If enable pull-up is desired in the CMOS/TTL mode, an external ≤20kΩ resistor connecting EN to V_{CC} will override the on-chip pull-down resistor.

Outputs Q/$\overline{Q}$ each have a selectable on-chip pull-down current source. See the current source truth table for current source functions. External resistors may also be used to increase pull-down current to a maximum of 25mA (includes internal on-chip current source).

FUNCTIONALITY MLP8 PACKAGE (AZV99NB & AZV99ND)

The MLP8 NA, NB and ND options of the AZV99 provide a PECL/ECL level enable input ($\overline{EN}$). When the $\overline{EN}$ input is LOW, the $\overline{Q}$ and Q_{HG}/$\overline{Q}_{HG}$ outputs pass data from the inputs. When $\overline{EN}$ is HIGH, the $\overline{Q}$ output continues to pass data while the Q_{HG} output is forced high and the $\overline{Q}_{HG}$ output is forced low.

Only the $\overline{Q}$ output operates with a current source (4 mA) to V_{EE}. This is accomplished by internal bonding of CS-SEL. An external resistor may also be used to increase pull-down current to a maximum of 25mA (includes 4mA on-chip current source).

The AZV99NB and AZV99ND versions operate with a single ended data input (D). The $\overline{D}$ input is internally bonded directly to the V_{BB} pin bypassing the 470Ω bias resistor.

FUNCTIONALITY MLP8 PACKAGE (AZV99N) & MSOP8 PACKAGE (AZV99T)

The MSOP8 (T) and MLP8 (N) versions of the AZV99 provide a CMOS/TTL level enable input (EN). When the EN input is HIGH, the $\overline{Q}$ and Q_{HG}/$\overline{Q}_{HG}$ outputs pass data from the inputs. When EN is LOW, the $\overline{Q}$ output continues to pass data while the Q_{HG} output is forced high and the $\overline{Q}_{HG}$ output is forced low.

Only the $\overline{Q}$ output operates with a current source (4 mA) to V_{EE}. This is accomplished by internal bonding of CS-SEL. An external resistor may also be used to increase pull-down current to a maximum of 25mA (includes 4mA on-chip current source).

The MSOP8 (T) and MLP8 (N) AZV99 operates with a single ended data input (D). The $\overline{D}$ input is internally bonded directly to the V_{BB} pin bypassing the 470Ω bias resistor.

Table 6 – Enable Truth Table

EN-SEL	EN/ $\overline{EN}$	Q/$\overline{Q}$	Q_{HG}	$\overline{Q}_{HG}$
NC	PECL Low, V_{EE} or NC	Data	Data	Data
	PECL High or V_{CC}	Data	High	Low
V_{EE} [1]	CMOS/TTL Low, V_{EE} or NC	Data	High	Low
	CMOS/TTL High or V_{CC} [2]	Data	Data	Data

1 EN-SEL connections must be less than 1Ω.

2 An external ≤ 20kΩ pull-up resistor between EN and VCC ensures a High when the EN pin is not driven.
